

90-DAY ENTRY PLAN

Earn the right to standardize by shipping one complete engagement.

DAYS 1-15 Enter and map - Embed with signed client and shadow operators, executives, data owners, compliance, and technical stakeholders. - Map workflow, exceptions, informal authority, data gaps, failure cost, and change anxiety. - Write one shared engagement contract: outcome, owner, user, authority, evidence, recovery. Outputs: Live-operation map; authority map; baseline; bounded first use case.	DAYS 16-30 Build the first real workflow - Choose the smallest use case with real value and platform learning. - Build directly with the right mix of orchestration, APIs, retrieval, deterministic rules, and human review. - Define evaluation, auditability, fallback, escalation, and owner. Outputs: Working prototype; evaluation set; authority boundary; recovery design.
DAYS 31-60 Operate to proof - Run with real operators and real exceptions. - Track quality, cycle time, rework, trust, exception burden, economics, and recovery. - Treat operator behavior as workflow-fit evidence; iterate until the result exists in the operation. Outputs: Outcome scorecard; exception taxonomy; adoption record; hardened workflow.	DAYS 61-90 Return and repeat - Separate client-specific context from reusable capability. - Package workflow logic, authority, evaluation, recovery, and adoption learning. - Install engagement review cadence and future strategist quality criteria. Outputs: Platform-return package; playbook; next-use-case pipeline; hiring standard.

Day-90 Scorecard

Client outcome	What materially changed in the operation?
Workflow reliability	How well are normal, exception, and failure paths handled?
Human trust	Do operators and executives understand, use, and improve it?
Control quality	Are authority, evidence, audit, and recovery explicit?
Platform leverage	What became reusable in ValonOS?
Learning speed	What makes engagement two faster?

No orphaned client wins.

A successful engagement is incomplete until its reusable context, controls, evaluation, and change-learning return to the platform and the next strategist.
